

Lab 2: Agile Backlog Creation & Sprint Simulation in Jira

PROBLEM STATEMENT:- Faculty Research Grant & Publication Tracker

NAME:- Dandu Nivas Reddy

SRN:-PES1UG24AM075

Figure 1: Jira backlog showing the project Epics, User Stories, priorities, and Story Point estimates.

Figure 2: Sprint board showing progress of user stories through the Agile workflow.

Figure 3: Burndown Chart for CMWCP Sprint 2 showing remaining story points.

Reflection Questions

1. Did your estimations reflect the actual effort?

Answer:

The story point estimations provided a reasonable representation of the relative effort required for the user stories. Higher-point stories such as Book Counseling Session required more effort compared with smaller stories such as Generate Anonymous Pseudo-ID. Overall, the Fibonacci-based estimation helped differentiate the complexity of the work

2. Was your backlog well-prioritized?

Answer:

Yes. The backlog was prioritized according to the importance and user impact of the functionality. High-priority functionality such as assessing stress levels and managing counseling-related activities was placed appropriately so that important features could be addressed first.

3. How did your simulated sprint align with your plan?

Answer:

The simulated sprint allowed the selected user stories to be moved through the Agile workflow from To Do to In Progress and finally to Done. The sprint helped demonstrate how planned backlog items can be organized, estimated and completed within a sprint.

4. What insights did the burndown chart give about your team's capacity?

Answer:

The burndown chart showed how the remaining story points decreased as work was completed. It provided a visual indication of sprint progress and helped identify whether the planned work was being completed within the sprint duration. It also demonstrated the team's ability to complete the committed work.
